The Adobe Photoshop Lightroom isn't for you if you want to edit your photo and it's intended for professional use. You need to have the Adobe Photoshop program to use it. If you don't, we recommend that you turn to some of the many tutorials that show you how to edit photos in Photoshop Lightroom or other simpler photo-editing programs. Photoshop's editing tools enable you to:

- * Change the color of an image, which we discuss in the "Knowing the Grayscale Color Modes" section later in this chapter.
- * Change the brightness, contrast, and saturation. For example, you can easily increase the overall brightness of an image, or darken an image by 100 percent or more.
- * Add or remove elements such as people, trees, furniture, and so on from a photo.
- * Crop the picture. Cropping is the art of moving some of a picture's elements outside of its frame. Cropping is particularly helpful in trimming a picture on a square canvas or getting rid of an annoying object in the picture.
- * Correct problems in the picture such as inconsistent exposure, too many or too few pixels, or a broken or incorrect picture file. Although Photoshop has a lot of features for photo editing, it's not the only photo-editing program for Macintosh computers. Instead, other image-editing programs can be used that are easier for beginners to work with and, some would say, a lot less intimidating than Photoshop.

* # Using a RAW photo in Photoshop If you look at a photo in its raw form, you don't see the colors — you just see their intensities. At this point, you're not familiar with how a digital camera produces digital photo files. In the previous section, "Getting started with Photoshop," we cover how to open a photo in Photoshop. In this section, we show you how to look at a RAW photo that you've opened in Photoshop and create a duplicate of the photo. The duplicate has the same intensity of color as the RAW photo, which makes it easier to edit. (RAW photos of this type are called `_RAW_` photos.) After you duplicate your RAW photo, you can make changes to the duplicate without altering the original. To duplicate a RAW photo, follow these steps:

1. **Start Photoshop and open a RAW photo that you want to duplicate.** See the upcoming section "Getting

Q: mod_wsgi python application is there a way to call a function of a different application on the same machine in this way? I have a large python based application (django based) running at /someapp and if I want to call a function inside it from the same application I have to do this: import someapp.app as app if app.mod.somefunc(): app.mod.somefunc() what I want is to call someapp.app.function() is this possible in this way? Thanks A: You could use a small hack: add an import someapp.app as app at the top of app.py, i.e. a standard python module that does not contain any application logic. That would allow you to access the module as if it were a top-level module. The End (1931 film)
