versioninfo: A small application that reads the version resource (or the first few bytes of the version resource) from an EXE file, displays information about the file and version resource. installer: An application that can install itself or its components on the computer. A typical installer will either be used to install itself on a target computer, or it will install itself on a different machine that is used to copy itself to a target computer. If you are not familiar with the term "self-extracting" or "self-installing" applications, think of it this way: For most applications, the installer program copies itself to the target computer and then executes, where the executable is deleted when the install is complete. In other words, the target computer has no "install" application on it at all, just the executable that the install program made. If you are not familiar with this idea, then be advised that the executable itself is not self-extracting or self-installing. Self-installing and self-extracting applications are applications that have their own installation process. When these applications are installed, they make modifications to the target computer. For example, the application might make changes to the registry, modify system files, or register a COM server. There are many types of self-installing and self-extracting applications. Here are some of the more common types of self-installing and self-extracting applications: Running EXE applications that make changes to the registry (for example, a virus) Running EXE applications that make changes to the hard disk or other storage media (for example, a backup application) EXE installers that make changes to the registry or other files EXE self-extracting applications that make changes to the registry or other files Run EXE application that does not use the Windows Installer. These are the applications that run the EXE file directly. For example, they could be applications like virus scanners, executable encryption programs, or applications that you downloaded from the Internet. Run EXE application that is a program that you downloaded from the Internet. This could be an application like a virus scanner or a backup program. These applications can be either self-installing or self-extracting applications. In a self-installing application, when the EXE file is run, it will make its own changes to the target computer and will delete itself 2edc1e01e8

What's New In EXEList?

EXEList is a small utility that displays information about EXE (and other loadable executable file types) files. It displays its EXE type and version resource, displays the details of the version resource and displays the possible locations of this version resource. The executable file type is displayed by the EXE version and is displayed by clicking on the file. The Version resource is read from the EXE file and the version number displayed in both the window and the tooltip. The utility is designed to be used with Microsoft Windows. The utility will work on Windows 95/98/NT/2000/XP. You can use the program with the version resource for older programs. Installation: Create a shortcut in the folder where you want to run the tool from. Use the key combination you chose as the command line. Usage: Press a key combination to start the EXE. Use any key combination to stop the EXE. Options: You can configure the EXE list window. The program will search for the EXE version resource in the following locations: C:\Windows\Resources\Emsxem.exe C:\Windows\Resources\VCPRes\Emsxem.exe C:\Windows\Resources\Incwrd.exe C:\Windows\Resources\EmsInwrd.exe C:\Windows\Resources\Emsfrgr.exe C:\Windows\Resources\Emswmd.exe C:\Windows\Resources\Emsbfwrd.exe C:\Windows\Resources\Emsbfwmd.exe C:\Windows\Resources\Emsssc.exe C:\Windows\Resources\Emsssws.exe C:\Windows\Resources\Emsssw.exe C:\Windows\Resources\Emssswr.exe C:\Windows\Resources\Emsns.exe C:\Windows\Resources\Emsnsr.exe C:\Windows\Resources\Emsnsrr.exe C:\Windows\Resources\Emsd.exe C:\Windows\Resources\Emsdw.exe C:\Windows\Resources\Emsdw.exe C:\
