Photoshop CS2 is available for \$699 and a student version is available for \$299 from Adobe. With all versions you can upgrade to the latest release for free. A Tour of the Photoshop Interface Working with the Photoshop interface may be confusing to new users, but here's how to get

started with this amazing photo editing program. Figure 3-1 shows the basic process.

****Figure 3-1:**** A step-by-step instruction for using Photoshop. As with any programs, there is some trial-and-error with learning the interface. Sometimes an action will work on your computer and not on the program at all. Getting a Handle on the Basics While you can use the basic tools right away to create an image, it's easier and more efficient

to familiarize yourself with Photoshop's interface and functionality. The following sections describe and give you examples of the tools that are in the program. 1. Load your image. First you must import the image into Photoshop. To do so, drag your image file or click the Open button and load your image file.

Photoshop opens a preview area that shows the image.

You can use the handles provided to resize the image or move it around the canvas.

2. Choose the item in the tools menu that you want to work with. The main menu includes the following item and submenu: • Effects ⇒ Adjustment ⇒ Curves is the curve tool for adjusting the exposure of your image. • Tools ⇒ Select ⇒ Feather is a great tool for blending one image with another and for creating a soft edge. • Layer ⇒ New Layer adds a new layer. • Layer ⇒ Layers is a drop-down list of layers and where they are positioned in

the document. • Layer ⇒
Unlock is a way to lock or
unlock all the tools on a layer.

• Layer ⇒ Lock/Unlock
changes the tools on one layer
from locked to unlocked or
vice versa. 3. Choose a tool, or
use the keyboard commands
to perform an action. You use
the keyboard shortcuts and
other commands to do the
specific editing you need to
do in Photoshop. For example,
the keyboard shortcut to close
the image is Ctrl+F4, and the
keyboard shortcut for the

layer palette is Ctrl+J, which means Ctrl+J to Layer, Ctrl+J to Layer Properties, or just Ctrl+J

that the cerebral cortex can be seen as an "assembler", and not just an information processor. He says that the cortex has been uniquely effective at reproducing itself using just the smallest incrementally changing input. In a metaphor that comes down to the fundamental question of how you get to know the world, he uses the example of being able to recognize that one thing is the same as another thing, even though the two things may

differ only slightly. Edelman's argument comes down to a question of the origin of information: how do you get knowledge about the world, how do you get to know the world if you are blind to it? He says it is a question, but the answer is that it is not a question and the only way to know it is to be conscious. In order to be conscious, there has to be an "assembler". He calls it an "end-organ-assembler". It can be illustrated with respect to the

brain's visual cortex, called the occipital lobe. It is a big part of the brain's cortex, but it's hard to tell if it is doing anything interesting. If one were to try to look at it, the brain would not react as one would expect if there were nothing going on in it. If you were to ask someone what they were seeing, they would say they can't see anything. With a functional magnetic resonance (fMRI) scan, it would look like a black hole. What the cortex is doing is

building a "bias" in the patterns of signals that the sensory areas of the brain feed to it. It is an instance of the generic intelligence of the cortex to be able to use bias. Daniel Dennett, in his book *Elbow Room*, described having experienced a near-death experience and coming to the conclusion that the result was that he had not died but had "recreated". He says that he had simply noticed that he could do many new things that he had never been able to

do before. Bridget Benton's book *Vision and Visibility* argues that there is no question that images are intrinsically interesting. She suggests that the real question is: why have brains evolved to select and present images to us? She argues that it is, in fact, an adaptation to maximize the chances of survival in our three-dimensional environment, and that the image processing machinery of the brain is a complex instrument of

evolution that has happened to
work out pretty well. If there
