It is a powerful antiviral agent and is effective against various viruses, including herpes viruses, parvovirus, poxvirus, adenovirus, and cytomegalovirus. AZT is used in the treatment of HIV infection. Its mechanism of action in HIV infection is to halt the reproduction of the viral particles, thus stopping the spread of the virus. The most important side effects of AZT are pancreatitis and, less often, liver toxicity. Currently, the combination of AZT and 3TC is the most widely prescribed anti-HIV drug, and a combination of ZDV and 3TC is the recommended first line regimen for all classes of HIV-infected patients. AZT has been shown to be effective in treating HBV and HCV infections. AZT is a derivative of 3'-azido-3'-deoxythymidine. AZT is available in the U.S. as two oral preparations, AZT and Retrovir.
